Environmental Benefits

We have thousands of native species under threat or at risk of extinction in Aotearoa New Zealand. Many of our most threatened species and habitats are found outside of conservation land. Current investment is falling short of what is needed to protect biodiversity and ecosystems.

Climate Change mitigation

Biodiversity comes with Ecosystem Services; mangroves for sea level rise, sponge cities, green cities etc.

Protects taonga

Biodiversity credit systems enable individuals and companies to invest in projects that contribute to protecting, restoring and enhancing biodiversity with confidence.

Climate Change adaptation

Internationally and in Aotearoa New Zealand, there is an increasing awareness amongst the business community and wider public that we need healthy environments.

Systems thinking

Biodiversity is complex. Climate change and biodiversity loss are not two separate issues but one.
